

Reliability atlas shows promotion, demotion and abstention across public Y-tree hypotheses

Background points define reliability context; highlighted audit cards are predeclared benchmarks; decision gates show promotion, demotion and no-call criteria.

a YFull reliability atlas

b Atlas state counts	
2,466 ordered source-receiver hypotheses	
● Robust compatible	118
✕ Robust rejection	206
✕ Stable rejection (scale-sensitive D)	87
▲ Fragile / scale-sensitive	145
■ No-call / underpowered	214
■ Broad-root deferred	1,696

c Decision gate	
Figure-reading grammar, not additional evidence	
● Promote	load-bearing eligible
▲ Demote	support or boundary only
■ No-call/deferred	abstain

Directional compatibility alone is not sufficient for promotion.

Sources: numbered Figure 2 source-data bundle. The plotted coordinate window is cropped for readability; full atlas coordinates are provided in the source data. Background points are broad YFull atlas source-receiver hypotheses; highlighted markers are predeclared focused audit cards, not atlas-screen discoveries. Decision-gate text summarizes predeclared promotion, demotion and no-call criteria and does not reclassify atlas rows. The figure does not classify geographic origin, ethnic identity, population continuity, migration route or population-level probability.
